

Running the Shapefile Processing Script

1. Submit a test record

- Open your Survey123 form
- Fill out required fields
- Upload a zipped shapefile (.zip) as an attachment
- Submit the form

2. Open Python environment

Open Application: ArcGIS Python Command Prompt

3. Activate environment

```
conda activate summit_env
```

4. Navigate to script folder

```
cd C:\Users\JXN_G\Desktop\6161\summit_script\scripts
```

5. Run the script

```
python process_shapefile_attachments_v2.py
```

6. Log in (if prompted)

- Enter your ArcGIS organization URL: utah.maps.arcgis.com
- Sign in using your **U of U credentials**

7. Confirm success

Look for output like:

OID ###: success

8. Verify results

- Open your feature layer or dashboard
- Confirm:
 - geometry updated
 - polygon appears correctly
 - attributes (e.g., GISAcres) updated

Notes

Script must be run manually (not automatic)

Only records with zipped shapefile attachments will be processed

Script can be rerun anytime to process new submissions

One-line summary

The script converts uploaded shapefile attachments into feature geometry and updates the hosted layer used by the dashboard.
